

Enhancing vehicle and driver productivity has never been easier!

Increase business efficiency and customer service

Enterprise Mobile Resource Manager is a Web-based solution that provides companies real time visibility into the locations and activities of their mobile resources. The results? Greater efficiency and superior customer service.

The benefits to you

Vehicle Tracking and Reporting

Real time GPS tracking allows you to know when and where your vehicles are immediately or via historical reports. Other customizable reports allows you to manage the exceptions defined by your business needs. Alerts can be set automatically or reports downloaded in various forms for ease of use.

Wireless Job Dispatching and Time Tracking

Connectivity between the Garmin units and the Web interface makes real time monitoring of job status easy. Jobs are dispatched directly to the Garmin units, and drivers can return job status through the Garmin units back to the Web interface. This enhanced connectivity increases billing accuracy and improves customer service.

Messaging

Efficient communication between office and fleet is critical to staying on time and on budget. Text messages can be sent by dispatchers to individual drivers' Garmin units, and drivers can respond by sending a message back to the Web interface. This leads to fewer phone calls between fleet and office, saving time for both dispatchers and drivers.

Navigation

When a driver gets lost, it wastes both time and money. With navigation, driving directions are sent along with dispatched jobs, guiding drivers to their locations using the best routes. This reduces both "windshield time" and excess fuel consumption.

List of Key Features

- Exception reporting for more effective fleet and driver management
- Real time GPS locations
- Historical GPS track and trace (up to 30 days back)
- Google Maps interface (street and satellite views)
- Wireless job dispatching and real-time job status
- Geofencing (notification of when workers enter or exit specific areas)
- Speed tracking with speeding alerts and reports
- Stop time tracking with stop alerts and reports
- Two-way messaging to users and groups
- Web-based reports
